Shelby County Schools Science Vision

Shelby County Schools' vision of science education is to ensure that from early childhood to the end of the 12th grade, all students have heightened curiosity and an increased wonder of science; possess sufficient knowledge of science and engineering to engage in discussions; are able to learn and apply scientific and technological information in their everyday lives; and have the skills such as critical thinking, problem solving, and communication to enter careers of their choice, while having access to connections to science, engineering, and technology.

To achieve this, Shelby County Schools has employed The Tennessee Academic Standards for Science to craft meaningful curricula that is innovative and provide a myriad of learning opportunities that extend beyond mastery of basic scientific principles.

Introduction

In 2014, the Shelby County Schools Board of Education adopted a set of ambitious, yet attainable goals for school and student performance. The District is committed to these goals, as further described in our strategic plan, Destination 2025. In order to achieve these ambitious goals, we must collectively work to provide our students with high quality standards aligned instruction. The Tennessee Academic Standards for Science provide a common set of expectations for what students will know and be able to do at the end of each grade, can be located in the Tennessee Science Standards Reference. Tennessee Academic Standards for Science are rooted in the knowledge and skills that students need to succeed in post-secondary study or careers. While the academic standards establish desired learning outcomes, the curricula provides instructional planning designed to help students reach these outcomes. The curriculum maps contain components to ensure that instruction focuses students toward college and career readiness. Educators will use this guide and the standards as a roadmap for curriculum and instruction. The sequence of learning is strategically positioned so that necessary foundational skills are spiraled in order to facilitate student mastery of the standards.

Our collective goal is to ensure our students graduate ready for college and career. Being College and Career Ready entails, many aspects of teaching and learning. We want our students to apply their scientific learning in the classroom and beyond. These valuable experiences include students being facilitators of their own learning through problem solving and thinking critically. The Science and Engineering Practices are valuable tools used by students to engage in understanding how scientific knowledge develops. These practices rest on important "processes and proficiencies" with longstanding importance in science education. The science maps contain components to ensure that instruction focuses students toward understanding how science and engineering can contribute to meeting many of the major challenges that confront society today. The maps are centered around five basic components: the Tennessee Academic Standards for Science, Science and Engineering Practices, Disciplinary Core Ideas, Crosscutting Concepts, and Phenomena.

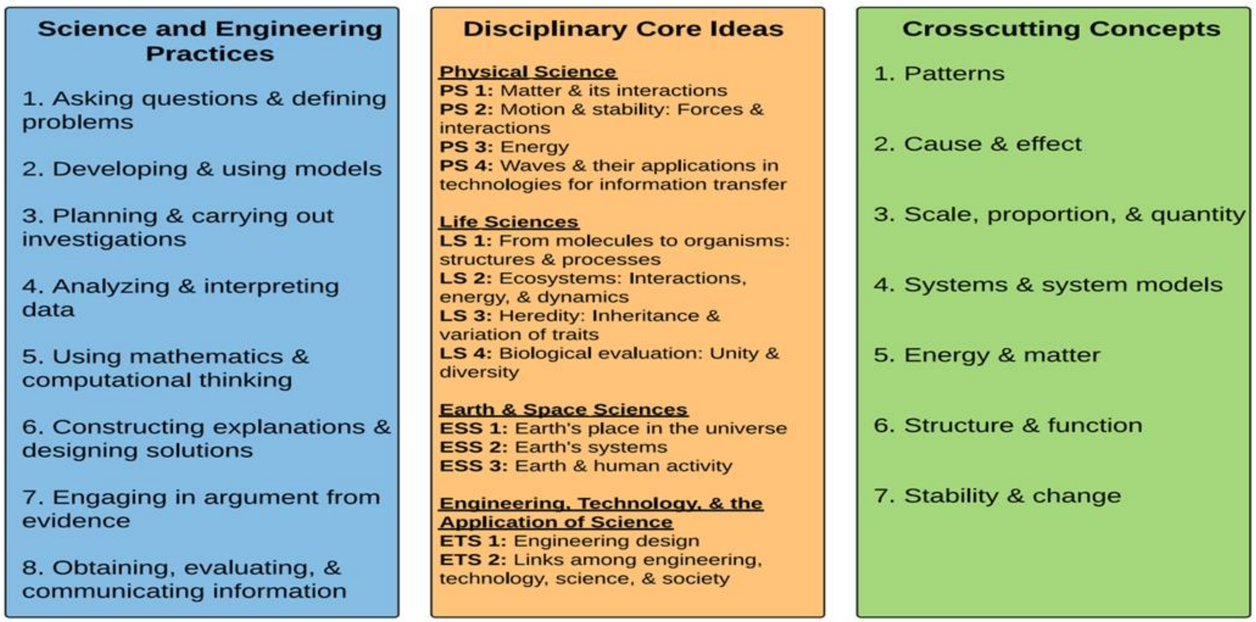
The Tennessee Academic Standards for Science were developed using the National Research Council's 2012 publication, A Framework for K-12 Science Education as their foundation. The framework presents a new model for science instruction that is a stark contrast to what has come to be the norm in science classrooms. Thinking about science had become memorizing concepts and solving mathematical formulae. Practicing science had become prescribed lab situations with predetermined outcomes. The framework proposes a three-dimensional approach to science education that capitalizes on a child's natural curiosity. The Science Framework for K-12 Science Education provides the blueprint for developing the effective science practices. The *Framework* expresses a vision in science education that requires students to operate at the nexus of three dimensions of learning: Science and Engineering Practices, Crosscutting Concepts, and Disciplinary Core Ideas. The *Framework* identified a small number of disciplinary core ideas that all students should learn with increasing depth and sophistication, from Kindergarten through grade twelve. Key to the vision expressed in the *Framework* is for students to learn these disciplinary core ideas in the context of science and engineering practices. The importance of combining Science and Engineering Practices, Crosscutting Concepts and Disciplinary Core Ideas is stated in the *Framework* as follows:

Standards and performance expectations that are aligned to the framework must take into account that students cannot fully understand scientific and engineering ideas without engaging in the practices of inquiry and the discourses by which such ideas are developed and refined. At the same time, they cannot learn or show competence in practices except in the context of specific content. (NRC Framework, 2012, p. 218)

To develop the skills and dispositions to use scientific and engineering practices needed to further their learning and to solve problems, students need to experience instruction in which they use multiple practices in developing a particular core idea and apply each practice in the context of multiple core ideas. We use the term "practices" instead of a term such as "skills" to emphasize that engaging in scientific investigation requires not only skill but also knowledge that is specific to each practice. Students in grades K-12 should engage in all eight practices over each grade band**.** Crosscutting concepts have application across all domains of science. As such, they are a way of linking the different domains of science. Crosscutting concepts have value because they provide students with connections and intellectual tools that are related across the differing areas of disciplinary content and can enrich their application of practices and their understanding of core ideas. There are seven crosscutting concepts that bridge disciplinary boundaries, uniting core ideas throughout the fields of science and engineering. Their purpose is to help students deepen their understanding of the disciplinary core ideas and develop a coherent and scientifically based view of the world.

The map is meant to support effective planning and instruction to rigorous standards. It is *not* meant to replace teacher planning, prescribe pacing or instructional practice. In fact, our goal is not to merely "cover the curriculum," but rather to "uncover" it by developing students' deep understanding of the content and mastery of the standards. Teachers who are knowledgeable about and intentionally align the learning target (standards and objectives), topic, text(s), task, and needs (and assessment) of the learners are best-positioned to make decisions about how to support student learning toward such mastery.

Teachers are therefore expected--with the support of their colleagues, coaches, leaders, and other support providers--to exercise their professional judgment aligned to our shared vision of effective instruction, the Teacher Effectiveness Measure (TEM) and related best practices. However, while the framework allows for flexibility and encourages each teacher/teacher team to make it their own, our expectations for student learning are non-negotiable. We must ensure all of our children have access to rigor—high-quality teaching and learning to grade level specific standards, including purposeful support of literacy and language learning across the content areas.



Learning Progression

At the end of the elementary science experience, students can observe and measure phenomena using appropriate tools. They are able to organize objects and ideas into broad concepts first by single properties and later by multiple properties. They can create and interpret graphs and models that explain phenomena. Students can keep notebooks to record sequential observations and identify simple patterns. They are able to design and conduct investigations, analyze results, and communicate the results to others. Students will carry their curiosity, interest and enjoyment of the scientific world view, scientific inquiry, and the scientific enterprise into middle school.

At the end of the middle school science experience, students can discover relationships by making observations and by the systematic gathering of data. They can identify relevant evidence and valid arguments. Their focus has shifted from the general to the specific and from the simple to the complex. They use scientific information to make wise decision related to conservation of the natural world. They recognize that there are both negative and positive implications to new technologies.

As an SCS graduate, former students should be literate in science, understand key science ideas, aware that science and technology are interdependent human enterprises with strengths and limitations, familiar with the natural world and recognizes both its diversity and unity, and able to apply scientific knowledge and ways of thinking for individual and social purposes.

Structure of the Standards

- Grade Level/Course Overview: An overview that describes that specific content and themes for each grade level or high school course.
- Disciplinary Core Idea: Scientific and foundational ideas that permeate all grades and connect common themes that bridge scientific disciplines.
- Standard: Statements of what students can do to demonstrate knowledge of the conceptual understanding. Each performance indicator includes a specific science and engineering practice paired with the content knowledge and skills that students should demonstrate to meet the grade level or high school course standards.

Purpose of Science Curriculum Maps

This map is a guide to help teachers and their support providers (e.g., coaches, leaders) on their path to effective, college and career ready (CCR) aligned instruction and our pursuit of Destination 2025. It is a resource for organizing instruction around the Tennessee Academic Standards for Science, which define what to teach and what students need to learn at each grade level. The map is designed to reinforce the grade/course-specific standards and content (scope) and provides *suggested* sequencing, pacing, time frames, and aligned resources. Our hope is that by curating and organizing a variety of standards-aligned resources, teachers will be able to spend less time wondering what to teach and searching for quality materials (though they may both select from and/or supplement those included here) and have more time to plan, teach, assess, and reflect with colleagues to continuously improve practice and best meet the needs of their students.

The map is meant to support effective planning and instruction to rigorous standards. It is *not* meant to replace teacher planning, prescribe pacing or instructional practice. In fact, our goal is not to merely "cover the curriculum," but rather to "uncover" it by developing students' deep understanding of the content and mastery of the standards. Teachers who are knowledgeable about and intentionally align the learning target (standards and objectives), topic, text(s), task, and needs (and assessment) of the learners are best-positioned to make decisions about how to support student learning toward such mastery. Teachers are therefore expected--with the support of their colleagues, coaches, leaders, and other support providers--to exercise their professional judgment aligned to our shared vision of effective instruction, the Teacher Effectiveness Measure (TEM) and related best practices. However, while the framework allows for flexibility and encourages each teacher/teacher team to make it their own, our expectations for student learning are non-negotiable. We must ensure all of our children have access to rigor—high-quality teaching and learning to grade level specific standards, including purposeful support of literacy and language learning across the content areas.

UNIT 2: Relationships Among Organisms (4 weeks)

Overarching Question(s)

How and why do organisms interact with the living and nonliving environments to obtain matter and energy?

Unit 2, Lesson 1	**Lesson Length**	**Essential Question**	**Vocabulary**
Introduction to Ecology	1 week	How are different parts of the environment connected?	ecology, population, ecosystem, niche, biotic factor, species, biome, abiotic factor, community, habitat

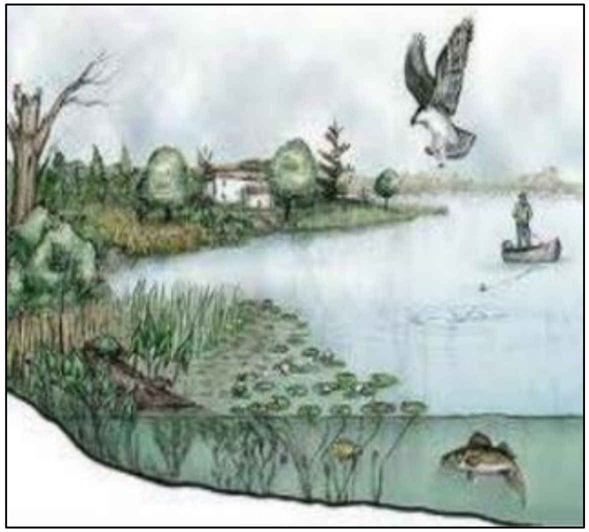
Standards and Related Background Information	**Instructional Focus**	**Instructional Resources**
DCI(s) LS2: Ecosystems: Interactions, Energy, and Dynamics **Standard(s)** 6.LS2.1 Evaluate and communicate the impact of environmental variables on population size. 6.LS2.4 Using evidence from climate data, draw conclusions about the patterns of abiotic and biotic factors in different biomes, specifically the tundra, taiga, deciduous forest, desert, grasslands, rainforest, marine, and freshwater ecosystems.	**Learning Outcomes** • Describe the field of ecology. • Distinguish between abiotic and biotic factors. • Describe the different levels of organization in an environment. • Describe the factors that characterize a biome. • Relate ecosystems to biomes. • Identify major land biomes. • Identify major aquatic ecosystems. • Describe why populations live in a specific location.	**Curricular Materials** HMH Tennessee Science TE, Unit 2, Lesson 1 pp. 84-97 Engage • Living or Nonliving? Activity, TE p. 86 • Engage Your Brain #s 1 and 2, SE p. 73 • Active Reading #s 3 and 4, SE p. 73 Explore Ecology • Recognizing Relationships Activity, TE p. 86 Levels of Organization in an Environment

Explanation(s) Support of Standard(s) from TN Science Reference Guide

6.LS2.1 Organisms have needs for similar resources: food, water, and habitat. The abundance of a particular resource can have an impact on an individual organism. So, by extension, the abundance of that resource may also impact the population as a whole. Students should be exposed to multiple sources and types of data on populations (e.g. size, reproductive rates, and growth information over time). Students should use their evaluations of both individual organisms and populations as functions of a particular environmental variable to communicate whether observed patterns indicate causation or merely correlation.

Increasing population sizes result in increased competition for these resources. An ecosystem will increase in size until it reaches its carrying capacity. Examples may include a population of antelope decreasing because of a drought and then the lion population decreasing also as a result. Another example could include the relationship between deer and wolf populations: When the deer population increases, the wolf population will increase until it causes the deer population to decrease, which in turn causes the wolf population to decrease, and the cycle continues. Each of these variables dictates the niche of the organism, for

Suggested Phenomenon



Ecology includes interactions among organisms and their environment. This picture represents several biotic factors but also includes abiotic factors needed for the organisms' survival. Students can complete a See Think Wonder Template after examining the picture.

Possible Guiding Question(s):
What are the living and nonliving items pictured?
What is the relationship between those items?

example, the wolf is the carnivore and tertiary consumer in its ecosystem. 6.LS2.4 Ecosystems can be seen as "organisms" with specific needs for energy similar to individual organisms. Just as organisms have identifiable characteristics, so too do ecosystems. Ecosystems are identifiable by both physical and biological components. This standard allows students to look at various regions on Earth and observe that similar combinations of biotic and abiotic factors persist and that these allow the classification of ecosystems into certain types. Emphasis is the connection between living and non-living factors in ecosystem stability: temperature and pattern of global ocean and wind currents, the temperature of the air that is blown onto land, and then the causation of climate to dictate the type of abiotic factors. For example, the tundra has a lot of ice and permafrost because it is in the northern Hemisphere, does not receive direct sunlight so the water currents and resulting wind currents are cold, which causes a cold climate. Only biotic factors adapted to those abiotic factors can survive in that biome.		Evaluate Formative Assessment • Throughout TE • Lesson Review, SE p. 83 Summative Assessment • Introduction to Ecology Alternative Assessment, TE p. 91 Lesson Quiz **Additional Resources** • Population Growth Patterns cK-12 Resources • Population Growth Limits cK-12 Resources • Mission: Biomes! • Biomes cK-12 Content • To Plant or Not To Plant • Scientists Say: Niche • Exploring the "Systems" in Ecosystems **ESL Supports and Scaffolds** WIDA Standard 4 - The Language of Science To support students in speaking refer to this resource: WIDA Doing and Talking Science Sample Language Objectives: (language domain along with a scaffold)

Suggested Science and Engineering Practice(s) Obtaining, Evaluating, and Communicating Information 6.LS2.1 (O/E) Students can evaluate text, media, and visual displays of information with the intent of clarifying claims and reconciling explanations. (C) Students can communicate scientific information in writing utilizing embedded tables, charts, figures, graphs. Engaging in Argument from Evidence 6.LS2.4 Students present an argument based on empirical evidence, models, and invoke scientific reasoning. **Suggested Crosscutting Concept(s)** Cause and Effect 6.LS2.1 Students recognize that some cause and effect explanations are merely a correlation of factors. Patterns 6.LS2.4 Students recognize, classify, and record patterns in data, graphs, and charts.		Students will use a sentence frame and pre-taught vocabulary to describe the field of ecology in writing. Students will use a T-Chart to compare and contrast sentence frames to distinguish between abiotic and biotic factors by talking with a partner. Pre-teach vocabulary: (Consider teaching this vocabulary in addition to vocabulary addressed in the standard to support Entering Level ELs) connected, community, resources, organism Ecosystems visuals and simplified language Biomes visuals To support students with the scientific explanation: Model speaking and writing expectations for Entering Level ELs. Consider using the recommended stems to support students in their discussions and writing. Use graphic organizers or concept maps to support students in their comparison of abiotic versus biotic or compare/contrast sources. Provide compare/contrast sentence stems:

		This is the same as because . This is different than because . All these are because . , and all have/are . When applicable - use Home Language to build vocabulary in concepts. Spanish Cognates Interactive Science Dictionary with visuals To support students with the scientific explanation: Question Starters What's the connection between….? What link do you see between… Why do you think…? What is our evidence that…. Do we have enough evidence to make that claim? But what about this other evidence that shows….? But does your claim account for…(evidence) Response Starters I agree with you because of (evidence or reasoning) I don't agree with your claim because of (evidence or reasoning) This evidence shows that… Your explanation makes me think about …..

Overarching Question(s)

How and why do organisms interact with their environment and what are the effects of these interactions?

Unit 2, Lesson 2	Lesson Length	Essential Question	Vocabulary
Roles in Energy Transfer	1 week	How does energy flow through an ecosystem?	omnivore, consumer, herbivore, carnivore, food chain, decomposer, producer, food web, energy pyramid

Standards and Related Background Information	Instructional Focus	Instructional Resources
DCI(s) LS2: Ecosystems: Interactions, Energy, and Dynamics **Standard(s)** 6.LS2.3 Draw conclusions about the transfer of energy through a food web and energy pyramid in an ecosystem.	**Learning Outcomes** • Describe life's energy source. • Explain how producers get energy. • Give examples of producers. • Define photosynthesis. • Explain how decomposers get energy and give examples. • Describe the importance of decomposers in an ecosystem. • Explain how consumers get energy. • Compare and contrast types of consumers, and identify examples of each.	**Curricular Materials** HMH Tennessee Science TE, Unit 2, Lesson 2 pp. 100-115 Engage • Engage Your Brain #s 1 and 2, SE p. • Active Reading #s 3 and 4, SE p. Explore Producers/Decomposers • Energy Role Game Quick Lab, TE p. 103 Food Chains, Food Webs, and Energy Pyramids • Energy Pathways Activity, TE p. 102

Explanation(s) and Support of Standard(s) from TN Science Reference Guide 6.LS2.3 Students should be able to consider the transfer of energy between three groups: producers, consumers, and decomposers. Transfer of energy into an ecosystem by consumers is accompanied by transfer of matter. Sources for matter (water, air) include non-living parts of the ecosystem. Energy radiated by the sun is captured by plants and used to combine matter to store chemical energy (food). Inputs of matter into the ecosystem accompany the Sun's energy capture. Consumers combine the food with oxygen, permitting the use of the stored energy and matter for growth. Throughout its lifetime, an organism will use, on average, 90 percent of the energy it consumes. Ultimately, this 90% of energy is released back into the environment as heat. The remaining 10% can be passed along to further consumers or decomposers. The flow of energy and the flow of matter within the ecosystem are entirely connected, yet we see matter cycle between living and non-living components of the ecosystem, while energy flows into, out of, and within ecosystems. (Emphasis for energy flow should be placed on the 10% rule and how energy is transferred to the environment as heat and approximately 10% of potential energy is passed to the next trophic level.)	• Differentiate between a food chain, food web, energy pyramid. • Explain energy flow in a web and identify organisms' roles. • Make inferences the regarding removal of a(n) organism(s) from a food web. **Suggested Phenomenon**  Click on the picture to view an oceanic feeding frenzy in which sharks, fish, whales, and birds interact to obtain food (energy). This food web in action displays the many interactions within an ecosystem, including living and nonliving components. Students can complete a See Think Wonder Template while watching the video.	Explain • Think Outside the Book, SE p. 90 Producers/Decomposers • Active Reading #6, SE p. 90 Consumers • Visualize It! #7, SE p. 91 • Infer #8, SE p. 91 Food Chains, Food Webs, and Energy Pyramids • Active Reading #9, SE p. 92 • Visualize It! #s 10-13, SE pp. 92-93 • Active Reading #14, SE p. 94 • Visualize It! #15, SE p. 94 • Visualize It! #16, SE p. 96 • Think Outside the Book #17, SE p. 97 • Visualize It! #s 18 and 19, SE p. 98 Extend Reinforce and Review • Cluster Diagram Graphic Organizer, TE p. 106 • Visual Summary, SE p. 100 Going Further • Earth Science Connection, TE p. 106 • Mathematics Connection, TE p. 106 Why It Matters, SE p. 99 Evaluate Formative Assessment • Throughout TE • Lesson Review, SE p. 101 Summative Assessment

Suggested Science and Engineering Practice(s) Developing and Using Models 6.LS2.3 Students create models which are responsive and incorporate features that are not visible in the natural world, but have implications on the behavior of the modeled systems and can identify limitations of their models. **Suggested Crosscutting Concept(s)** Energy and Matter 6.LS2.3 Students track energy changes through transformations in a system.		• Roles in Energy Transfer Alternative Assessment, TE p. 107 • Lesson Quiz **Additional Resources** • Building an Energy Pyramid Lab and Cedar Glade Species List • Popcorn Relay Race • Food Chain Game • Got Energy? How and why do organisms interact with their environment and what are the effects of these interactions?

Unit 2, Lesson 4	Lesson Length	Essential Question	Vocabulary
Interactions in Communities	1 week	How do organisms interact?	predator, mutualism, competition, prey, parasitism, symbiosis, commensalism

Standards and Related Background Information	Instructional Focus	Instructional Resources
DCI(s) LS2: Ecosystems: Interactions, Energy, and Dynamics **Standard(s)** 6.LS2.2 Determine the impact of competitive, symbiotic, and predatory interactions in an ecosystem. 6.LS2.7 Compare and contrast auditory and visual methods of communication among organisms in relation to survival strategies of a population.	**Learning Outcomes** • Explain the difference between a predator vs, prey. • Explain how the abundance of a prey species affects the abundance of a predator species, and vice versa. • Identify adaptations that help predators and prey survive. • Explain symbiosis. • Distinguish between the three types of symbiosis. • Explain why communication is important among organisms.	**Curricular Materials** HMH Tennessee Science TE, Unit 2, Lesson 4 pp. 130-143 Engage • Engage Your Brain #s 1 and 2, SE p. • Active Reading #s 3 and 4, SE p. Explore Predation • Prey Coloration Quick Lab, TE p. 133 • Identifying Predators and Prey Quick Lab, TE p. 133 • Modeling the Predator-Prey Cycle Exploration Lab, SE p. 132

Explanation(s) and Support of Standard(s) [from TN Science Reference Guide] 6.LS2.2 Population sizes are influenced by the interactions of organisms within the ecosystem. Predators can decrease population sizes, while mutualistic relationships create a sort of interdependence where the two populations within a community move in tandem. Changes in one population may result in changes to different populations. Students should be familiar with several basic patterns for interactions between organisms: competitive, symbiotic (mutualistic) and predatory. These general patterns for interactions are not limited to specific ecosystems; they are observable in many different ecosystems. Specific examples might be used to support the idea that mutually beneficial relationships between two species might occur when resources are scarce, but be less common when resources are abundant. (The focus should be on relationships within a food web of an ecosystem and the recognition of types of symbiosis, not on specific examples.) 6.LS2.7 Students should ask questions and postulate about the advantages and disadvantages of group sociality in animal populations. Since humans do not have the ability to comprehend the language of	• Describe visual communication. • Describe auditory communication. • Explain how competition occurs. • Describe resources for which organisms compete. **Suggested Phenomenon**  Shelby Farms Park is home to a thriving herd of buffalo (American bison)! There are usually around 15 buffalo roaming the Park each year. Click on the picture to view the symbiotic relationship among birds and buffalo that roam Shelby Farms. Students can complete a See Think Wonder Template while watching the video.	Competition • What Are You Fighting For? Activity, TE p. 132 • Competing for Resources Virtual Lab, TE p. 133 Explain Predation • Active Reading #5, SE p. 120 • Compare #6, SE p. 120 • Think Outside the Book #7, SE p. 121 • Visualize It! #8, SE p. 121 Symbiosis • Active Reading #9, SE p. 122 • Symbiosis Discussion, TE p. 132 • Compare #10, SE p. 122 • Summarize #11, SE p. 123 • Think Outside the Book #12, SE p. 123 Communication • Visualize It! #13, SE p. 124 Competition • Active Reading #14, SE p. 126 • Predict #15, SE p. 126 • Think Outside the Book #16, SE p. 126 Extend Reinforce and Review • Symbiosis Game Activity, TE p. 136 • Cluster Diagram Graphic Organizer, TE p. 136 • Visual Summary, SE p. 128 Going Further • Social Studies Connection, TE p. 136

other species, we must infer then support the purpose for various forms of communication in other species. When we observe unique behaviors in animals, we search for an explanation for the purpose of that behavior. Groups of organisms cease to exist if the group no longer provides a benefit to its individuals. Students may begin to draw conclusions about survival and reproduction based on observed communications. Examples include communication in social animals such as meerkats in the presence of different predators and how that can impact individual survival. Other examples include the predatory communication of group hunters such as the spotted hyena, African Hunting Dogs, and Orcas. Plant communication may include pheromones. **Suggested Science and Engineering Practice(s)** Constructing Explanations and Designing Solutions 6.LS2.2 Students form explanations using source (including student developed investigations) which show comprehension of parsimony, utilize quantitative and qualitative models to make predictions, and can support or cause revisions of a particular conclusion.		• Human Biology Connection, TE p. 136 • Why It Matters, SE p. 127 Evaluate Formative Assessment • Throughout TE • Lesson Review, SE p. 129 Summative Assessment • Interactions in Communities Alternative Assessment, TE p. 137 • Lesson Quiz **Additional Resources** • 6.LS2.2 Student Activity, Teacher Guide, Argument Wolf Restoration Article, Argument Simulation Cards 1, and Argument Simulation Cards 2 • Symbiotic Relationships CPALMS Lesson and Activities • Exploring Symbiosis Activity • Visual Communication Examples • Auditory Communication Examples • Wolf Quest • Welcome to the Arctic's All-Night Undersea Party Science News for Students Article • Symbiosis: The Art of Living Together Newsela Article • Wolves of Yellowstone Video

Asking Questions (for Science) and Defining Problems (for Engineering) 6.LS2.7 Questions originate based on experience as well as need to clarify and test other explanations, or determine explicit relationships between variables. **Suggested Crosscutting Concept(s)** Patterns 6.LS2.2 Students recognize, classify, and record patterns in data, graphs, and charts. Systems and System Models 6.LS2.7 Students recognize, classify, and record patterns in data, graphs, and charts		**ESL Supports and Scaffolds** WIDA Standard 4- The Language of Science To support students in speaking refer to this resource: WIDA Doing and Talking Science When applicable - use Home Language to build vocabulary in concepts. Spanish Cognates Interactive Science Dictionary with visuals Sample Language Objectives: (language domain along with a scaffold): Students will read a text and use a graphic organizer to explain how the abundance of a prey species affects the abundance of a predator species, and vice versa by working with a partner. Students will use visuals to identify adaptations that help predators and prey survive and write a complete sentence using a word box to describe how adaptations help predators survive. Species interaction visuals Species interaction video

		Pre-teach vocabulary: (Consider teaching this vocabulary in addition to vocabulary addressed in the standard to support Entering Level ELs) adapt; adaptation; interact; survival; organism; interdependence; population To support students with the scientific explanation: Model speaking and writing expectations for Entering Level ELs. Consider using the recommended stems to support students in their discussions and writing. Sentence Frames: Identifying: Here we see that____________________. How and why do organisms interact with their environment and what are the effects of these interactions?

Unit 3, Lesson 1	Lesson Length	Essential Question	Vocabulary
Land Biomes	1 week	What are land biomes?	biome, taiga, deciduous tree, grassland, tundra, desert, coniferous tree

Standards and Related Background Information	Instructional Focus	Instructional Resources
DCI(s) LS2: Ecosystems: Interactions, Energy, and Dynamics **Standard(s)** 6.LS2.4 Using evidence from climate data, draw conclusions about the patterns of abiotic and biotic factors in different biomes, specifically the tundra, taiga, deciduous forest, desert, grasslands, rainforest, marine, and freshwater ecosystems.	**Learning Outcomes** • Explain what a biome is and provide examples of biomes. • Describe what differentiates one biome from another. • Describe the relationship between biomes and ecosystems. • Describe the tundra and taiga biomes. • Describe the desert and grassland biomes. • Provide examples of plant and animal adaptations. • Describe the temperate forest and tropical rain forest biomes.	**Curricular Materials** HMH Tennessee Science TE, Unit 2, Lesson 4 pp. 156-169 Engage • Engage Your Brain #s 1 and 2, SE p. • Active Reading #s 3 and 4, SE p. Explore Biomes • Biome Competition Activity, TE p. 158 Explain Biomes • Visualize It! #5, SE p. 142 • Active Reading #6, SE p. 143

Explanation(s) and Support of Standard(s) from TN Science Reference Guide 6.LS2.4 Ecosystems can be seen as "organisms" with specific needs for energy similar to individual organisms. Just as organisms have identifiable characteristics, so too do ecosystems. Ecosystems are identifiable by both physical and biological components. This standard allows students to look at various regions on Earth and observe that similar combinations of biotic and abiotic factors persist and that these allow the classification of ecosystems into certain types. Emphasis is the connection between living and non-living factors in ecosystem stability: temperature and pattern of global ocean and wind currents, the temperature of the air that is blown onto land, and then the causation of climate to dictate the type of abiotic factors. For example, the tundra has a lot of ice and permafrost because it is in the northern Hemisphere, does not receive direct sunlight so the water currents and resulting wind currents are cold, which causes a cold climate. Only biotic factors adapted to those abiotic factors can survive in that biome. **Suggested Science and Engineering Practice(s)** Engaging in Argument from Evidence 6.LS2.4 Students present an argument based on empirical evidence, models, and invoke scientific reasoning.	• Provide examples of plant and animal adaptations within each biome. **Suggested Phenomenon** Why might a cactus have an easier time surviving in Las Vegas, NV than in Memphis, TN? Discuss this idea with students, giving them time to generate and record their ideas.	• Visualize It! #7, SE p. 143 • Visualize It! #8, SE p. 144 Tundra and Taiga • Active Reading #9, SE p. 145 • Visualize It! #10, SE p. 145 Desert and Grasslands • Active Reading #11, SE p. 146 • Visualize It! #12, SE p. 146 • Visualize It! #13, SE p. 147 Temperate Forest and Tropical Rain Forest • Visualize It! #14, SE p. 148 • Think Outside the Book #15, SE p. 148 Visualize It! #16, SE p. 149 Extend Reinforce and Review • Land Biomes in Review Activity, TE p. 162 • Layered Book Graphic Organizer, TE p. 162 • Visual Summary, SE p. 150 Going Further • Social Studies Connection, TE p. 162 Evaluate Formative Assessment • Throughout TE • Lesson Review, SE p. 151 Summative Assessment • Exploring Land Biomes Alternative Assessment, TE p. 163 • Lesson Quiz

External agents will cause changes (even in healthy ecosystems), but a resilient ecosystem will stabilize. Examples may include the change in the world's oceans, changes in climate over time or an increase in human populations. Students can plan and carry out a research to model this process. 6.LS4.1 Biodiversity can both increase and decrease. Increases in biodiversity occur when new species of organisms emerge, but the loss of a species decreases biodiversity. Healthy ecosystems exist in a state of dynamic equilibrium. In this state, ecosystems are able to recover from disturbances. The level of biodiversity in an ecosystem is an indicator of the health of an ecosystem. Low levels of biodiversity amplify the effects of disturbances, as the effect on a single species may spread across several niches. Biodiversity also includes the observation of a variety of characteristics within a single population or species to promote the survival of that species. To model the effects of biodiversity in an ecosystem, consider two food webs of varying biodiversity, and consider the effects of the removal of one of the species within this food web. Examples may include the loss of potentially medicinal plants in the rainforest, a shortage of potable water, ecosystems with population extinctions, and overfishing causing a decrease in the ability for human consumption of ocean species.		Summative Assessment • Changes in Ecosystems Alternative Assessment, TE p. 193 • Lesson Quiz **Additional Resources** • Wolves of Yellowstone National Park Article • Global Climate Change EPA Article • Biodiversity Video and Activity Collection • Wolf Quest • How Wolves Change Rivers Video • What is Biodiversity? whether or not changes that can be seen in established populations might be caused by the change to the ecosystem, or if the two events are merely coincidental. External agents will cause changes (even in healthy ecosystems), but a resilient ecosystem will stabilize. Examples may include the change in the world's oceans, changes in climate over time or an increase in human populations. Students can plan and carry out research to model this process. 6.LS4.1 Biodiversity can both increase and decrease. Increases in biodiversity occur when new species of organisms emerge, but the loss of a species decreases biodiversity. Healthy ecosystems exist in a state of dynamic equilibrium. In this state, ecosystems are able to recover from disturbances. The level of biodiversity in an ecosystem is an indicator of the health of an ecosystem. Low levels of biodiversity amplify the effects of disturbances, as the effect on a single species may spread across several niches. Biodiversity also includes the observation of a variety of characteristics within a single population or species to promote the survival of that species. To model the effects of biodiversity in an ecosystem, consider two food webs of varying biodiversity, and consider the effects of the removal of one of the species within this food web. Examples		**ESL Supports and Scaffolds** WIDA Standard 4 - The Language of Science To support students in speaking refer to this resource: WIDA Doing and Talking Science When applicable - use Home Language to build vocabulary in concepts. Spanish Cognates Interactive Science Dictionary with visuals Sample Language Objectives: (language domain along with a scaffold): Students will work with a partner to explain how human activities impact water quality and quantity by writing a paragraph using pre-taught vocabulary Students will use a text to identify words that define water population, eutrophication, and acid rain. Pre-teach vocabulary: (Consider teaching this vocabulary in addition to vocabulary addressed in the standard to support Entering Level ELs) activities, impact, quality, quantity, affect To support students with the scientific explanation: Model speaking and writing

may include the loss of potentially medicinal plants in the rainforest, a shortage of potable water, ecosystems with population extinctions, and overfishing causing a decrease in the ability for human consumption of ocean species. 6.LS4.2 The living world provides humans with many materials they need, and humans can dramatically reshape the land and interactions between living systems to meet those needs. Patterns in human development have typically been negative with consequences (e.g., overpopulation, over use of resources, destruction of habitat, pollution). Thoughtful consideration is needed if humans are to reduce their impacts. Many of these negative consequences feed into a subsequent loss of biodiversity that can then have negative impacts for humans. Natural resources that can be threatened by disturbing environmental equilibrium include food, energy, and medicines as well as the loss of services provided by ecosystems including water purification and recycling of nutrients by decomposers. Stability 6.ETS1.1 The wording and specificity of an engineering problem is a major factor in the quality of the solutions that may be created for a particular problem. Effective problems should have clear		expectations for Entering Level ELs. Consider using the recommended stems to support students in their discussions and writing. Sentence Frames: I think ___________ is ________________ because ____________. I like _________ because ___________ The __________ had ____________ so ________. Due to the fact that ____________ The _____________ is _______________ because__________________________

design constraints that incorporate scientific understanding. Constraints should recognize that humans have needs that are met only through use of natural resources, but balance the importance of those needs with stewardship responsibilities. For example, attempting to eliminate an invasive species may only result in replacing one invasive species with a new invasive species or knowledge of local climate might influence plantings. Examples include comparing recycling programs (deposits, curbside pickup, drop-off centers) and the cost/benefit analysis of recycling solutions. Address engineering design issues centered on water treatment (filtration, chemical treatment, reverse osmosis). Design solutions to minimize soil erosion (forestry practices, farming techniques, construction, and recreation). Examples of design solutions could include scientific, economic, or social considerations. **Suggested Science and Engineering Practice(s)** Constructing Explanations and Designing Solutions 6.LS2.5 Students form explanations using source (including student developed investigations) which show comprehension of parsimony, utilize quantitative and qualitative models to make predictions, and can support or cause revisions of a particular conclusion.		

Obtaining, Evaluating, and Communicating Information 6.LS2.6 (O/E) Students can evaluate text, media, and visual displays of information with the intent of clarifying claims and reconciling explanations. (C) Students can communicate scientific information in writing utilizing embedded tables, charts, figures, graphs. Engaging in Argument from Evidence 6.LS4.1 Students present an argument based on empirical evidence, models, and invoke scientific reasoning. Engaging in Argument from Evidence 6.LS4.2 Students present evaluations of a solution or device that include student designed tests and give consideration to constraints and criteria for success Asking Questions (for Science) and Defining Problems (for Engineering) 6.ETS1.1 Students define design problems, invoking scientific background knowledge to define multiple criteria and constraints for solutions. **Suggested Crosscutting Concept(s)** Cause and Effect 6.LS2.5 Students use cause and effect relationships to make predictions.		

<u>Stability and Change</u> 6.LS2.6, 6.LS4.1, 6.LS4.2, 6.ETS1.1 Students explain that systems in motion or dynamic equilibrium can be stable.
