Shelby County Schools Science Vision

Shelby County Schools' vision of science education is to ensure that from early childhood to the end of the 12th grade, all students have heightened curiosity and an increased wonder of science; possess sufficient knowledge of science and engineering to engage in discussions; are able to learn and apply scientific and technological information in their everyday lives; and have the skills such as critical thinking, problem solving, and communication to enter careers of their choice, while having access to connections to science, engineering, and technology.

To achieve this, Shelby County Schools has employed The Tennessee Academic Standards for Science to craft meaningful curricula that is innovative and provide a myriad of learning opportunities that extend beyond mastery of basic scientific principles.

Introduction

In 2014, the Shelby County Schools Board of Education adopted a set of ambitious, yet attainable goals for school and student performance. The District is committed to these goals, as further described in our strategic plan, Destination 2025. In order to achieve these ambitious goals, we must collectively work to provide our students with high quality standards aligned instruction. The Tennessee Academic Standards for Science provide a common set of expectations for what students will know and be able to do at the end of each grade, can be located in the Tennessee Science Standards Reference. Tennessee Academic Standards for Science are rooted in the knowledge and skills that students need to succeed in post-secondary study or careers. While the academic standards establish desired learning outcomes, the curricula provides instructional planning designed to help students reach these outcomes. The curriculum maps contain components to ensure that instruction focuses students toward college and career readiness. Educators will use this guide and the standards as a roadmap for curriculum and instruction. The sequence of learning is strategically positioned so that necessary foundational skills are spiraled in order to facilitate student mastery of the standards.

Our collective goal is to ensure our students graduate ready for college and career. Being College and Career Ready entails, many aspects of teaching and learning. We want our students to apply their scientific learning in the classroom and beyond. These valuable experiences include students being facilitators of their own learning through problem solving and thinking critically. The Science and Engineering Practices are valuable tools used by students to engage in understanding how scientific knowledge develops. These practices rest on important "processes and proficiencies" with longstanding importance in science education. The science maps contain components to ensure that instruction focuses students toward understanding how science and engineering can contribute to meeting many of the major challenges that confront society today. The maps are centered around five basic components: the Tennessee Academic Standards for Science, Science and Engineering Practices, Disciplinary Core Ideas, Crosscutting Concepts, and Phenomena.

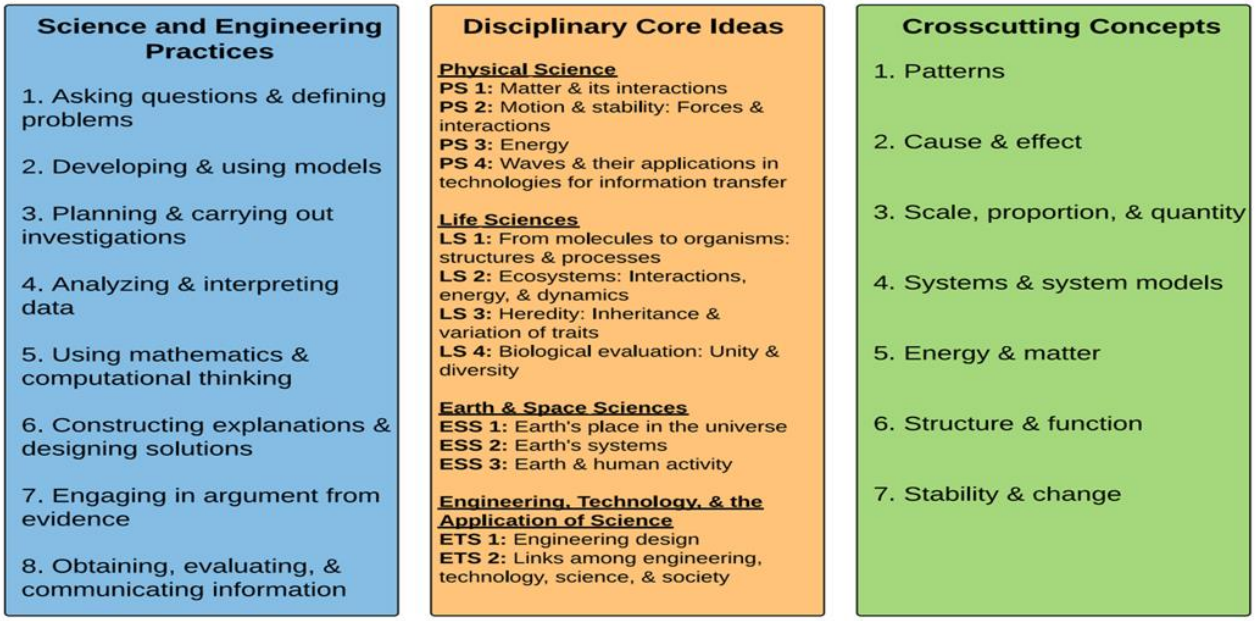
The Tennessee Academic Standards for Science were developed using the National Research Council's 2012 publication, A Framework for K-12 Science Education as their foundation. The framework presents a new model for science instruction that is a stark contrast to what has come to be the norm in science classrooms. Thinking about science had become memorizing concepts and solving mathematical formulae. Practicing science had become prescribed lab situations with predetermined outcomes. The framework proposes a three-dimensional approach to science education that capitalizes on a child's natural curiosity. The Science Framework for K-12 Science Education provides the blueprint for developing the effective science practices. The *Framework* expresses a vision in science education that requires students to operate at the nexus of three dimensions of learning: Science and Engineering Practices, Crosscutting Concepts, and Disciplinary Core Ideas. The *Framework* identified a small number of disciplinary core ideas that all students should learn with increasing depth and sophistication, from Kindergarten through grade twelve. Key to the vision expressed in the *Framework* is for students to learn these disciplinary core ideas in the context of science and engineering practices. The importance of combining Science and Engineering Practices, Crosscutting Concepts and Disciplinary Core Ideas is stated in the *Framework* as follows:

Standards and performance expectations that are aligned to the framework must take into account that students cannot fully understand scientific and engineering ideas without engaging in the practices of inquiry and the discourses by which such ideas are developed and refined. At the same time, they cannot learn or show competence in practices except in the context of specific content. (NRC Framework, 2012, p. 218)

To develop the skills and dispositions to use scientific and engineering practices needed to further their learning and to solve problems, students need to experience instruction in which they use multiple practices in developing a particular core idea and apply each practice in the context of multiple core ideas. We use the term "practices" instead of a term such as "skills" to emphasize that engaging in scientific investigation requires not only skill but also knowledge that is specific to each practice. Students in grades K-12 should engage in all eight practices over each grade band**.** Crosscutting concepts have application across all domains of science. As such, they are a way of linking the different domains of science. Crosscutting concepts have value because they provide students with connections and intellectual tools that are related across the differing areas of disciplinary content and can enrich their application of practices and their understanding of core ideas. There are seven crosscutting concepts that bridge disciplinary boundaries, uniting core ideas throughout the fields of science and engineering. Their purpose is to help students deepen their understanding of the disciplinary core ideas and develop a coherent and scientifically based view of the world.

The map is meant to support effective planning and instruction to rigorous standards. It is *not* meant to replace teacher planning, prescribe pacing or instructional practice. In fact, our goal is not to merely "cover the curriculum," but rather to "uncover" it by developing students' deep understanding of the content and mastery of the standards. Teachers who are knowledgeable about and intentionally align the learning target (standards and objectives), topic, text(s), task, and needs (and assessment) of the learners are best-positioned to make decisions about how to support student learning toward such mastery.

Teachers are therefore expected--with the support of their colleagues, coaches, leaders, and other support providers--to exercise their professional judgment aligned to our shared vision of effective instruction, the Teacher Effectiveness Measure (TEM) and related best practices. However, while the framework allows for flexibility and encourages each teacher/teacher team to make it their own, our expectations for student learning are non-negotiable. We must ensure all of our children have access to rigor—high-quality teaching and learning to grade level specific standards, including purposeful support of literacy and language learning across the content areas.



Learning Progression

At the end of the elementary science experience, students can observe and measure phenomena using appropriate tools. They are able to organize objects and ideas into broad concepts first by single properties and later by multiple properties. They can create and interpret graphs and models that explain phenomena. Students can keep notebooks to record sequential observations and identify simple patterns. They are able to design and conduct investigations, analyze results, and communicate the results to others. Students will carry their curiosity, interest and enjoyment of the scientific world view, scientific inquiry, and the scientific enterprise into middle school.

At the end of the middle school science experience, students can discover relationships by making observations and by the systematic gathering of data. They can identify relevant evidence and valid arguments. Their focus has shifted from the general to the specific and from the simple to the complex. They use scientific information to make wise decision related to conservation of the natural world. They recognize that there are both negative and positive implications to new technologies.

As an SCS graduate, former students should be literate in science, understand key science ideas, aware that science and technology are interdependent human enterprises with strengths and limitations, familiar with the natural world and recognizes both its diversity and unity, and able to apply scientific knowledge and ways of thinking for individual and social purposes.

Structure of the Standards

- Grade Level/Course Overview: An overview that describes that specific content and themes for each grade level or high school course.
- Disciplinary Core Idea: Scientific and foundational ideas that permeate all grades and connect common themes that bridge scientific disciplines.
- Standard: Statements of what students can do to demonstrate knowledge of the conceptual understanding. Each performance indicator includes a specific science and engineering practice paired with the content knowledge and skills that students should demonstrate to meet the grade level or high school course standards.

Purpose of Science Curriculum Maps

This map is a guide to help teachers and their support providers (e.g., coaches, leaders) on their path to effective, college and career ready (CCR) aligned instruction and our pursuit of Destination 2025. It is a resource for organizing instruction around the Tennessee Academic Standards for Science, which define what to teach and what students need to learn at each grade level. The map is designed to reinforce the grade/course-specific standards and content (scope) and provides *suggested* sequencing, pacing, time frames, and aligned resources. Our hope is that by curating and organizing a variety of standards-aligned resources, teachers will be able to spend less time wondering what to teach and searching for quality materials (though they may both select from and/or supplement those included here) and have more time to plan, teach, assess, and reflect with colleagues to continuously improve practice and best meet the needs of their students.

The map is meant to support effective planning and instruction to rigorous standards. It is *not* meant to replace teacher planning, prescribe pacing or instructional practice. In fact, our goal is not to merely "cover the curriculum," but rather to "uncover" it by developing students' deep understanding of the content and mastery of the standards. Teachers who are knowledgeable about and intentionally align the learning target (standards and objectives), topic, text(s), task, and needs (and assessment) of the learners are best-positioned to make decisions about how to support student learning toward such mastery. Teachers are therefore expected--with the support of their colleagues, coaches, leaders, and other support providers--to exercise their professional judgment aligned to our shared vision of effective instruction, the Teacher Effectiveness Measure (TEM) and related best practices. However, while the framework allows for flexibility and encourages each teacher/teacher team to make it their own, our expectations for student learning are non-negotiable. We must ensure all of our children have access to rigor—high-quality teaching and learning to grade level specific standards, including purposeful support of literacy and language learning across the content areas.

Standards and Related Background Information	**Instructional Focus**	**Instructional Resources**
DCI(s) 6.PS3: Energy **Standard(s)** 6.PS3.4 Conduct an investigation to demonstrate the way that heat (thermal energy) moves among objects through radiation, conduction, or convection. **Explanation(s)and Support of Standard(s) from TN Science Reference Guide** 6.PS3.4 In everyday language, "heat" is used to refer to thermal energy (the motion of particles) and	**Learning Outcomes** • Describe what is required by all living things on Earth. • Describe how Earth's proximity to the sun produces a unique surface temperature range. • Explain how Earth's rotation allows efficient energy use. • Describe how plants on Earth use solar energy to make food. • Compare the supply of water on Earth to the supply of water on other planets in our solar system.	**Curricular Materials** HMH Tennessee Science TE, Unit 4, Lesson 1 pp. 236-239 Engage • Engage Your Brain #s 1 and 2, SE p. 213 • Active Reading #s 3 and 4, SE p. 213 Explore The Sun • Measuring the Sun's Heat Activity, TE p. 238 • Temperature Variations on Earth Quick Lab, TE p. 239

energy transfer. Students should comprehend the difference between these two uses, and understand that scientist only use the term heat when referencing energy transfer from one object to another. The colloquial use of "heat" to describe the amount of warmth an object possesses should be abandoned, in favor of the use of "thermal energy." Thermal energy is the total energy due to the movement of particles in a substance. Thermal energy is related to temperature which can be measured using a thermometer, however thermal energy must also account for mass of the sample. There are three specific means of heating: conduction, convection, and radiation. Radiation (infrared or visible light) can be seen as a form of heating, but is unique from conduction and convection, because it can transfer energy across empty space. Students can observe changes in thermal energy (by recording temperature) or changes in state (by observing pure substances) using any of the above methods of heating. **Suggested Science and Engineering Practice(s)** Planning and Carrying out Controlled Investigations 6.PS3.4 Students begin to investigate independently, select appropriate independent variables to explore	• Explain how water accumulated on Earth's surface. • Explain how water supports the existence of life on Earth. • Compare the composition of Earth's atmosphere to those of other planets in the solar system. • Describe both the composition of and the formation of the atmosphere. • Explain how the atmosphere supports life. **Suggested Phenomenon**  Earth has many features that make it "special" or different from the other planets within our solar system. The existence of liquid water at Earth's surface is neither too much nor too little. Its proximity to the sun provide just the right amount of heat to support life. Earth is large enough to hang on to its atmosphere, but not so large to hold on to too much atmosphere and consequently too	Earth's Water • How Water Forms on Earth's Surface Quick Lab, TE p. 239 Earth's Atmosphere • Modeling the Atmosphere Activity, TE p. 238 • Whip It Up! this then infers that non-renewable resources must develop over longer periods of time. Beyond mere memorization of those parameters, students should recognize that the processes that create mineral, groundwater, and energy (fuels) happen at geologic rates as a result of geologic processes. Because geologic processes do not occur uniformly, there is not a uniform distribution of resources. (e.g., oil deposits in the middle east, coal deposits in the western United States, gold deposits in California, the use of Tennessee waterways for hydroelectric power generation.) As humans use nonrenewable resources, they are restored, but in amounts of time that greatly exceed those of near generations. Thus, these resources are considered limited. It is not intended that students memorize the processes for the formation of all non-renewables, but rather to understand that they are in some way connected to geologic processes. A limited number of examples can be used to establish this idea. **Suggested Science and Engineering Practice(s)** <u>Constructing Explanations and Designing Solutions</u> 6.ESS3.1 Students form explanations using source (including student developed investigations) which show comprehension of parsimony, utilize quantitative and qualitative models to make predictions, and can support or cause revisions of a particular conclusion.	• Describe how the conversion between potential and kinetic energy provides energy that is useful to people. **Suggested Phenomenon**  The Earth has many natural resources that can be renewed in our lifetime, however, many cannot. Discuss this idea with students, giving them time to generate and record ideas. and gains of using a natural resource on the environment. Economic considerations include the amount of energy which can be harvested for the cost. For example, the economy of installing residential photovoltaic systems depends on the availability of sunlight in a person's location or on their property. Political conversations are impacted by considering global distributions of energy sources. As technologies progress, energy harvesting becomes less expensive and more efficient such that conversations regarding the utilization of renewable and alternate energy sources may shift over time. **Suggested Science and Engineering Practice(s)** Obtaining, Evaluating, and Communicating Information 6.ESS3.2 (O/E) Students can evaluate text, media, and visual displays of information with the intent of clarifying claims and reconciling explanations. (C) Students can communicate scientific information in writing utilizing embedded tables, charts, figures, graphs. Constructing Explanations and Designing Solutions 6.ESS3.1 Students form explanations using source (including student developed investigations) which show comprehension of parsimony, utilize quantitative and qualitative models to make predictions, and can support or cause revisions of a particular conclusion. Overarching Question(s)			
How do the Earth's surface processes and human activities affect each other?			
Unit 4, Lesson 5	**Lesson Length**	**Essential Question**	**Vocabulary**
Managing Resources	3 days	Why should natural resources be managed?	natural resource, nonrenewable resource, renewable resource, conservation, stewardship

Standards and Related Background Information	**Instructional Focus**	**Instructional Resources**
DCI(s) 6.ESS3: Earth and Human Activity **Standard(s)** 6.ESS3.1 Differentiate between renewable and nonrenewable resources by asking questions about their availability and sustainability. 6.ESS3.2 Investigate and compare existing and developing technologies that will utilize renewable and alternate energy sources.	**Learning Outcomes** • Describe what a natural resource is. • Describe the two main kinds of resources. • Describe the impacts of resource extraction, resource use, and resource disposal. • Explain the need for managing resources. • Explain how stewardship and conservation are related to resource management. • Describe the management practices for renewable and nonrenewable resources. • Describe ways to manage resources globally, nationally, and individually.	**Curricular Materials** HMH Tennessee Science TE, Unit 4, Lesson 5 pp. 300-313 Engage • Engage Your Brain #s 1 and 2, SE p. 275 • Active Reading #s 3 and 4, SE p. 275 • Non-Biodegradable Peanuts? Daily Demo, TE p. 303 Explore Resources • The Impact of Resource Extraction Quick Lab, TE p. 303

6.ESS3.3 Assess the impacts of human activities on the biosphere including conservation, habitat management, species endangerment, and extinction. **Explanation(s)and Support of standard(s) from TN Science Reference Guide** 6.ESS3.1 Renewable resources are resources that can be regenerated within a human lifetime. While this then infers that non-renewable resources must develop over longer periods of time. Beyond mere memorization of those parameters, students should recognize that the processes that create mineral, groundwater, and energy (fuels) happen at geologic rates as a result of geologic processes. Because geologic processes do not occur uniformly, there is not a uniform distribution of resources. (e.g., oil deposits in the middle east, coal deposits in the western United States, gold deposits in California, the use of Tennessee waterways for hydroelectric power generation.) As humans use nonrenewable resources, they are restored, but in amounts of time that greatly exceed those of near generations. Thus, these resources are considered limited. It is not intended that students memorize the processes for the formation of all non-renewables, but rather to understand that they are in some way connected to geologic processes. A limited number of examples can be used to establish this idea.	• Discuss the advantages and disadvantages of managing resources. **Suggested Phenomenon**  The Earth has many natural resources that can be renewed in our lifetime, however, many cannot. Discuss this idea with students, giving them time to generate and record ideas.	Explain Resources • Compare #5, SE p. 276 • Visualize It! #6, SE p. 277 • Active Reading #7 SE p. 277 • Visualize It! #s 8-10, SE p. 277 • Renewable or Not? Activity, TE p. 302 • Active Reading #11, SE p. 278 • Visualize It! #12, SE p. 278 • Apply #13, SE p. 279 • Changing Habits Take It Home, TE p. 302 • Managing a Resource Quick Lab, TE p. 303 Advantages and Disadvantages of Managing Resources • Active Reading #14, SE p. 280 • Visualize It! #15, SE p. 280 • Making Changes Discussion, TE p. 302 • Think Outside the Book #16, SE p. 281 • Visualize It! #17, SE p. 281 Extend Reinforce and Review • Magnet Word Graphic Organizer, TE p. 306 • Visual Summary, SE p. 282 Going Further • Math Connection, TE p. 306 • Earth Science Connection, TE p. 306

6.ESS3.2 Utilization of natural resources involves weighing environmental, economic, and oftentimes political conversations. Environmental discussions should include models which help to predict effects and gains of using a natural resource on the environment. Economic considerations include the amount of energy which can be harvested for the cost. For example, the economy of installing residential photovoltaic systems depends on the availability of sunlight in a person's location or on their property. Political conversations are impacted by considering global distributions of energy sources. As technologies progress, energy harvesting becomes less expensive and more efficient such that conversations regarding the utilization of renewable and alternate energy sources may shift over time. 6.ESS3.3 Beyond creating explanations for observations of changes to the environment, this standard can also be interpreted treated as a design task where students are developing a device to monitor human impacts, similar to 6.ESS2.4. Part of the design process should involve recognizing that many human activities are necessary, but analyzing the impacts of the activities can help to development responsible constraints. Human activities have greatly altered rates of change to Earth's surface. As humans develop land		Evaluate Formative Assessment • Reteach, TE p. 307 • Throughout TE • Lesson Review, SE p. 283 Summative Assessment • Managing Resources Alternative Assessment, TE p. 307 • Lesson Quiz • Unit 4 Big Idea, SE p. 286 Unit 4 Review, SE pp. 287-290 **Additional Resources** • Watch Your Step **ESL Supports and Scaffolds** WIDA Standard 4 - The Language of Science To support students in speaking refer to this resource: WIDA Doing and Talking Science Sample Language Objectives: (language domain along with a scaffold) • Students will work with a partner to identify how stewardship and conservation are related to resource management by using visuals, a graphic organizer, and text.

and build roads, large amounts of natural habitat are lost, affecting the species indigenous to that habitat. Students can obtain and evaluate evidence that increases in human populations or increases in the amount of energy consumed per person also increase negative effects, but engineered solutions can mitigate some of these negative effects. For example, development of low energy consumption lightbulbs (such as LED) can reduce the amount of energy used in a home. Assessments of human activities should include models which can assist in making predictions for the efficacy of conservation efforts with competing interests. **Suggested Science and Engineering Practice(s)** Obtaining, Evaluating, and Communicating Information 6.ESS3.2 (O/E) Students can evaluate text, media, and visual displays of information with the intent of clarifying claims and reconciling explanations. (C) Students can communicate scientific information in writing utilizing embedded tables, charts, figures, graphs. Constructing Explanations and Designing Solutions 6.ESS3.1 Students form explanations using source (including student developed investigations) which show comprehension of parsimony, utilize quantitative and qualitative models to make predictions, and can support or cause revisions of a particular conclusion.		Pre-teach vocabulary: (Consider teaching this vocabulary in addition to vocabulary addressed in the standard to support Entering Level ELs) manage, stewardship, kinds of Use graphic organizers or concept maps to support students in their explanations of why good stewardship is important to managing natural resources. Human Impact on Water	3 days	What impact can human activities have on water resources?	urbanization, desertification, land degradation, deforestation

Standards and Related Background Information	Instructional Focus	Instructional Resources
DCI(s) 6.ESS2: Earth Systems **Standard(s)** 6.ESS2.4 Apply scientific principles to design a method to analyze and interpret the impact of humans and other organisms on the hydrologic cycle.	**Learning Outcomes** • Explain why humans need water. • Explain why fresh water is a limited resource. • Explain the importance of water quality. • Compare supply and quality. • Define water pollution, point- source pollution, and non-point source pollution. • Define eutrophication and acid rain. • Describe water quality measures and monitoring. • Explain how water quality is maintained in the U.S.	**Curricular Materials** HMH Tennessee Science TE, Unit 5, Lesson 1 pp. 326-341 Engage • Engage Your Brain #s 1 and 2, SE p. 295 • Active Reading #s 3 and 4, SE p. 295 Explore • Ocean Pollution from Land Quick Lab, TE p. 329 Explain Water as a Resource • Visualize It! #5, SE p. 296

Explanation(s) and Support of Standard(s) [from TN Science Reference Guide]

6.ESS2.4 In 4.ESS2.3, students consider the ways that living organisms impact the land. This standard advances that idea, noting that the increase in the number of organisms present on the planet means that changes to the Earth will occur at a faster rate. Some effects on the land are inevitable as humans attempt to meet their needs, however analysis of impacts can inform sustainable use of resources. Impacts on the hydrologic cycle might include impacts on runoff, use or contamination of aquifers, etc.

Students designs might focus on how to minimize impacts as a consequence of what their monitoring suggests, however emphasis should be on types of data to be collected and how students might collect data on factors such as location, frequency, purpose for data, in order to begin to define or resolve a design task.

- Describe how urbanization can affect water quality.
- Define reservoir and urbanization.
- Explain how humans affect the fresh water flow and supply.

Suggested Phenomena

The Earth has a certain amount of water that is continuously moving over and under the Earth's surface. Humans affect the water cycle by polluting and taking water out of the system. Students can complete a See Think Wonder Template after examining the picture.

- Active Reading #6, SE p. 297

Water and Its Properties	2 days	What makes water so important?	polarity, specific heat, cohesion, solvent, adhesion

Standards and Related Background Information	Instructional Focus	Instructional Resources
DCI(s) 6.ESS2: Earth's Systems **Standard(s)** 6.ESS2.4 Apply scientific principles to design a method to analyze and interpret the impact of humans and other organisms on the hydrologic cycle.	**Learning Outcomes** • Explain water's importance to Earth's surface and weather, and to living organisms, including humans. • Describe the distribution of water on Earth. • Describe the structure of water. • Explain why water is a polar molecule. • Describe the three states of water on Earth. • Describe the properties of water in each of these three states.	**Curricular Materials** HMH Tennessee Science TE, Unit 6, Lesson 1 pp. 386-399 Engage and Explore • Engage Your Brain #s 1 and 2, SE p. 349 • Active Reading #s 3 and 4, SE p. 349 • Toss the Blue Planet Explain Importance and Distribution of Water • Do the Math #5, SE p. 350 • Active Reading #6, SE p. 350 • Visualize It! #7, SE p. 351

Explanation(s) and Support of Standard(s) [from TN Science Reference Guide]

6.ESS2.4 In 4.ESS2.3, student consider the ways that living organisms impact the land. This standard advances that idea, noting that the increase in the number of organisms present on the planet means that changes to the Earth will occur at a faster rate. Some effects on the land are inevitable as humans attempt to meet their needs, however analysis of impacts can inform sustainable use of resources. Impacts on the hydrologic cycle might include impacts on runoff, use or contamination of aquifers, etc.

Students designs might focus on how to minimize impacts as a consequence of what their monitoring suggests, however emphasis should be on types of data to be collected and how students might collect data on factors such as location, frequency, purpose for data, in order to begin to define or resolve a design task.

Suggested Science and Engineering Practice(s)

Using Mathematical and Computational Thinking

6.ESS2.4 Students can create ordered series of steps to evaluate the function of a device or understand a process.

Suggested Phenomenon

The Earth has a certain amount of water that is continuously moving over and under the Earth's surface. Humans affect the water cycle by polluting and taking water out of the system. Students can complete a See Think Wonder Template after examining the picture.

Possible Guiding Question(s):
Based on the picture, give specific examples of how humans are affecting the water cycle?
How can this be prevented or minimized?

Lesson Quiz

the design process should involve recognizing that many human activities are necessary, but analyzing the impacts of the activities can help to development responsible constraints. Human activities have greatly altered rates of change to Earth's surface. As humans develop land and build roads, large amounts of natural habitat are lost, affecting the species indigenous to that habitat. Students can obtain and evaluate evidence that increases in human populations or increases in the amount of energy consumed per person also increase negative effects, but engineered solutions can mitigate some of these negative effects. For example, development of low energy consumption lightbulbs (such as LED) can reduce the amount of energy used in a home. Assessments of human activities should include models which can assist in making predictions for the efficacy of conservation efforts with competing interests. **Suggested Science and Engineering Practice(s)** Using Mathematical and Computational Thinking 6.ESS2.4 Students can create ordered series of steps to evaluate the function of a device or understand a process. Constructing Explanations and Designing Solutions 6.ESS3.3 Students form explanations using source (including student developed investigations) which	The Earth has a certain amount of water that is continuously moving over and under the Earth's surface. Energy Transfer	1 week	How does energy move through Earth's system?	temperature, heat, conduction, thermal energy, radiation, atmosphere, thermal expansion, convection

Standards and Related Background Information	Instructional Focus	Instructional Resources
DCI(s) 6.ESS2: Earth Systems **Standard(s)** 6.ESS2.1 Gather evidence to justify that oceanic convection currents are caused by the sun's transfer of heat energy and differences in salt concentration leading to global water movement. 6.ESS2.2 Diagram convection patterns that flow due to uneven heating of the earth.	**Learning Outcomes** • Define temperature, heat, thermal energy, and thermal expansion. • Describe what happens when objects at different temperatures come into contact. • Summarize the process of radiation. • Describe the main source of energy on Earth's surface. • Identify examples of radiation on Earth. • Summarize the process of convection. • Identify examples of convection on Earth.	**Curricular Materials** HMH Tennessee Science TE, Unit 7, Lesson 1 pp. 444-458 Engage • Engage Your Brain #s 1 and 2, SE p. 401 • Active Reading #s 3 and 4, SE p. 401 • Transfer Energy Daily Demo, TE p. 447 • Modeling Convection Quick Lab, TE p. 447 Explore Radiation • Heat from the Sun S.T.E.M. Lab, TE p. 446

6.ESS2.3 Construct explanation for how atmospheric flow, geographic features, and ocean currents affect the climate of a region through heat transfer. **Explanation(s) and Support of Standard(s) from TN Science Reference Guide** 6.ESS2.1 Students should be able to use evidence to create models for how oceanic convection currents originate. Such a model should include not only the sun's warming of equatorial waters, but also the impact ice at the poles causing water to descend. The primary factors influencing ocean currents are unequal heating of the earth's surface, differences in energy transfer to land vs ocean, and density-related behaviors of heated or cooled water. Demonstrations of the temperature-based behavior can be performed by heating one side of a water-filled baking dish and cooling the opposite side. If the water is initially allowed to settle, drops of food coloring will trace out the convection patterns which develop. Pipets can be used to insert the food coloring into the lower currents. Demonstration of the effect of salt on creating a sinking mass of water can be accomplished by partially filling a large container with water then covering the surface of the water with plastic wrap and pouring an additional volume of salt containing, colored water onto the wrap. With the gentle removal of the plastic wrap, the mixing will be visible. Reversing the	• Summarize conduction. • Identify examples of conduction on Earth. **Suggested Phenomenon**  Possible Guiding Question(s): How is energy being transferred?	• The Sun's Angle and Temperature Quick Lab, TE p. 447 Explain Temperature, Heat, Thermal Energy, Thermal Expansion • Visualize It! #5, SE p. 402 • Predict #6, SE p. 403 • Inquiry #7, SE p. 403 • Active Reading #8, SE p. 404 • Visualize It! #9, SE p. 404 • Predict #10, SE p. 405 Radiation • Visualize It! #11, SE p. 406 • Summarize #12, SE p. 407 • Think Outside the Book #13, SE p. 407 Convection • Visualize It! #14, SE p. 408 • Active Reading #15, SE p. 409 • Visualize It! #16, SE p. 409 Conduction • Active Reading #17, SE p. 410 • Visualize It! #18, SE p. 410 • Summarize #19, SE p. 411 Extend Reinforce and Review • Energy Transfer Game, TE p. 450 • Pyramid Fold Note Graphic Organizer, TE p. 450 • Visual Summary, SE p. 412

order that the waters are added will provide the opposite effect. (From third grade, students will have developed understandings of mass and volume; however, the topic of density will need to be explored to fully support 6.ESS2.1 and 6.ESS2.2. Calculations of density are beyond the scope of this standard.) 6.ESS2.2 Models for which demonstrate convection patterns should incorporate the Sun, Earth (rotating), ocean, and land. The relationships between these components also make it possible to explain patterns in the distribution of climate types and resulting biomes (6.LS2.4). A model for heating of the Earth shows more direct heating of the earth's equator relative to the poles creating two large convection cells which move ascend at the equator and descend at the poles north and south poles. The Coriolis force, due to the Earth's spin breaks the two convection cells into a total of six cells, three in the southern hemisphere and three in the norther hemisphere. This breakup (Coriolis effect) can be modeled by a pair of students using a marker and a large sphere. If the sphere is stationary, a student can use a marker to draw a straight line from the equator to the poles. If the ball is rotated while drawing this same		Going Further • Real World Connection, TE p. 450 Evaluate Formative Assessment • Reteach, TE p. 451 • Throughout TE • Lesson Review, SE p. 413 Summative Assessment • Transfer of Energy Alternative Assessment, TE p. 451 • Lesson Quiz **Additional Resources** • Modeling Ocean Currents **ESL Supports and Scaffolds** WIDA Standard 4 - The Language of Science To support students in speaking refer to this resource: WIDA Doing and Talking Science Sample Language Objectives: (language domain along with a scaffold) Students will describe what happens when objects at different temperatures come into contact using visuals, a graphic organizer, and word box.

straight line, the resulting line drawn on the sphere will curve. Rate of rotation determines the severity of the curvature, Earth's rate of spin results in three cells, with deserts focused at latitudes near 30 degrees and 60 degrees north and south, and predictable surface winds. (Memorization of the names of specific global winds and layers of the atmosphere are beyond the scope of this standard.) 6.ESS2.3 A number of interacting parts contribute to the distribution of similar climates across the globe. Such components include factors addressed in 6.ESS2.2, as well as the ocean, land masses, different land surfaces, and impacts of living organisms. Student explanations can include the impact of solar energy on relative changes in temperature occurring in land/ocean (e.g., land warms more quickly), high altitudes/low altitudes (e.g., high altitudes have lower temperatures), and earth surfaces (e.g., ice reflects sunlight). Living things alter the surface types in an area, thus impacting energy transfer to affected areas. On land, surface features such as mountains can direct the flow of air masses upwards, inducing temperature related effects such as rain. While the Coriolis effect creates general patterns for distribution of similar climates, it is possible for the climate in a region to vary from the climate seen at		Use graphic organizers or concept maps to support students in their explanations of how energy moves through Earth's system. Academic vocabulary for "Explain": since, caused by, in effect, because of, tis results in, brought about, due to, consequently, made possible, for this reason, accordingly, as might be expected, therefore, as a result of, give rise to, If…then, leads to, was responsible for When applicable - use Home Language to build vocabulary in concepts. Spanish Cognates Interactive Science Dictionary with visuals

similar latitudes due to the presence of geographic features such as mountains or lakes. Coastal air rising over mountains will be depleted of its moisture and create deserts on the back side of the mountain. Likewise, large bodies of water can influence the temperature and humidity of a region due to the ability of water to store large amounts of thermal energy. **Suggested Science and Engineering Practice(s)** Engaging in Argument from Evidence 6.ESS2.1 Students present an argument based on empirical evidence, models, and invoke scientific reasoning. Developing and Using Models 6.ESS2.2 Students create models which are responsive and incorporate features that are not visible in the natural world, but have implications on the behavior of the modeled systems and can identify limitations of their models. Constructing Explanations and Designing Solutions 6.ESS2.3 Students form explanations using source (including student developed investigations) which show comprehension of parsimony, utilize quantitative and qualitative models to make predictions, and can support or cause revisions of a particular conclusion.		

Suggested Crosscutting Concept(s) Cause and Effect 6.ESS2.1 Students begin to connect their explanations for cause and effect relationships to specific scientific theory. Systems and System Models 6.ESS2.2 Students develop models for systems which include both visible and invisible inputs and outputs for that system. 6.ESS2.3 Students evaluate the sub-systems that may make up a larger system.

Describe winds where global pressure belts meet. • Define jet streams.	**Curricular Materials** HMH Tennessee Science TE, Unit 7, Lesson 2 pp. 464-477 Engage • Engage Your Brain #s 1 and 2, SE p. 421 • Active Reading #s 3 and 4, SE p. 421 Explore The Movement of Air • Rising Heat Quick Lab, TE p. 467 Explain The Movement of Air • Visualize It! #5, SE p. 422

Explanation(s) and Support of Standard(s) from TN Science Reference Guide 6.ESS2.2 Models for which demonstrate convection patterns should incorporate the Sun, Earth (rotating), ocean, and land. The relationships between these components also make it possible to explain patterns in the distribution of climate types and resulting biomes (6.LS2.4). A model for heating of the Earth shows more direct heating of the earth's equator relative to the poles creating two large convection cells which move ascend at the equator and descend at the poles north and south poles. The Coriolis force, due to the Earth's spin breaks the two convection cells into a total of six cells, three in the southern hemisphere and three in the norther hemisphere. This breakup (Coriolis effect) can be modeled by a pair of students using a marker and a large sphere. If the sphere is stationary, a student can use a marker to draw a straight line from the equator to the poles. If the ball is rotated while drawing this same straight line, the resulting line drawn on the sphere will curve. Rate of rotation determines the severity of the curvature, Earth's rate of spin results in three cells, with deserts focused at latitudes near 30 degrees and 60 degrees north and south, and predictable surface winds.	• Explain differences in the way land and water absorb and release energy cause local winds, such as sea, land, valley, and, mountain breezes. **Suggested Phenomenon**  In the absence of the Coriolis effect in the fixed model of the Earth, you can see the cold air from the poles and the warm air from the equator create 4 distinct convection cells. Since Earth rotates on its axis these large cells do not actually form. Descending air is deflected on the right breaking the large convection current into 3 distinct cells.	• Active Reading #6, SE p. 423 • Visualize It! #7, SE p. 423 • Modeling Air Movement by Convection Quick Lab, TE p. 467 Global Winds • Active Reading #8, SE p. 424 • Think Outside the Book #9, SE p. 424 • Visualize It! #10, SE p. 425 • Active Reading #11, SE p. 426 • Visualize It! #12, SE p. 426 • Jet Streams and Weather Discussion, TE p. 466 • Journey of a Trade Wind Activity, TE p. 466 Local Winds • Active Reading #16, SE p. 428 • Visualize It! #17, SE p. 428 • Visualize It! #18, SE p. 429 Extend Reinforce and Review • Cluster Diagram Graphic Organizer, TE p. 470 • Visual Summary, SE p. 430 Going Further • Astronomy Connection, TE p. 470 • Environmental Science Connection, TE 470 • Why It Matters, TE p. 471 Evaluate Formative Assessment • Reteach, TE p. 471 • Throughout TE

(Memorization of the names of specific global winds and layers of the atmosphere are beyond the scope of this standard.) 6.ESS2.3 A number of interacting parts contribute to the distribution of similar climates across the globe. Such components include factors addressed in 6.ESS2.2, as well as the ocean, land masses, different land surfaces, and impacts of living organisms. Student explanations can include the impact of solar energy on relative changes in temperature occurring in land/ocean (e.g., land warms more quickly), high altitudes/low altitudes (e.g., high altitudes have lower temperatures), and earth surfaces (e.g., ice reflects sunlight). Living things alter the surface types in an area, thus impacting energy transfer to affected areas. On land, surface features such as mountains can direct the flow of air masses upwards, inducing temperature related effects such as rain. While the Coriolis effect creates general patterns for distribution of similar climates, it is possible for the climate in a region to vary from the climate seen at similar latitudes due to the presence of geographic features such as mountains or lakes. Coastal air rising over mountains will be depleted of its moisture and create deserts on the back side of the mountain. Likewise, large bodies of water can influence the temperature and humidity of a region	The wind cells are created as alternating high and lows. Students can complete a See Think Wonder Template after examining the picture.	• Lesson Review, SE p. 431 Summative Assessment • Wind in the Atmosphere Alternative Assessment, TE p. 471 • Lesson Quiz **Additional Resources** • Air Pressure & Wind STUDY JAMS! 6.ESS2.3 Construct explanation for how atmospheric flow, geographic features, and ocean currents affect the climate of a region through heat transfer.

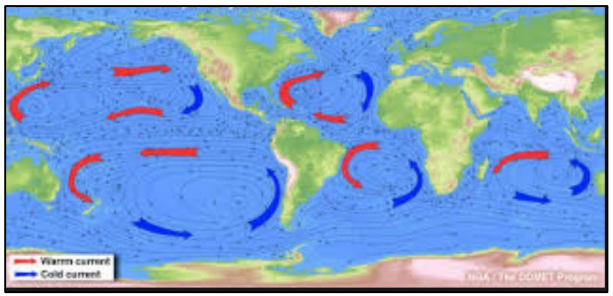
Explanation(s) and Support of Standard(s) from TN Science Reference Guide

6.ESS2.1 Students should be able to use evidence to create models for how oceanic convection currents originate. Such a model should include not only the sun's warming of equatorial waters, but also the impact ice at the poles causing water to descend.

The primary factors influencing ocean currents are unequal heating of the earth's surface, differences in energy transfer to land vs ocean, and density-related behaviors of heated or cooled water. Demonstrations of the temperature-based behavior can be performed by heating one side of a water-filled baking dish and cooling the opposite side. If the water is initially allowed to settle, drops of food coloring will trace out the convection patterns which develop. Pipets can be used to insert the food coloring into the lower currents. Demonstration of the effect of salt on creating a sinking mass of water can be accomplished by partially filling a large container with water then covering the surface of the water with plastic wrap and pouring an additional volume of salt containing, colored water onto the wrap. With the gentle removal of the plastic wrap, the mixing will be visible. Reversing the

- Give examples of how ocean currents transport matter and energy.

Suggested Phenomenon



One special property of water is that it is able to absorb large amounts of heat. Because the oceans make up 70% of Earth, there is a lot of heat in the oceans (even though they feel cool). Ocean waters closer to the equator receive more of the Sun's heat than ocean waters near the poles. Like the atmosphere, this temperature difference creates convection currents in the ocean. Warmer water rises up, and cooler water flows in to take its place, creating ocean currents. Students can complete a See Think Wonder Template after examining the picture.

Possible Guiding Question(s):
What is causes the arrows to move in a circular pattern?

order that the waters are added will provide the opposite effect. (From third grade, students will have developed understandings of mass and volume; however, the topic of density will need to be explored to fully support 6.ESS2.1 and 6.ESS2.2. Calculations of density are beyond the scope of this standard.) 6.ESS2.2 Models for which demonstrate convection patterns should incorporate the Sun, Earth (rotating), ocean, and land. The relationships between these components also make it possible to explain patterns in the distribution of climate types and resulting biomes (6.LS2.4). A model for heating of the Earth shows more direct heating of the earth's equator relative to the poles creating two large convection cells which move ascend at the equator and descend at the poles north and south poles. The Coriolis force, due to the Earth's spin breaks the two convection cells into a total of six cells, three in the southern hemisphere and three in the norther hemisphere. This breakup (Coriolis effect) can be modeled by a pair of students using a marker and a large sphere. If the sphere is stationary, a student can use a marker to draw a straight line from the equator to the poles. If the ball is rotated while drawing this same	Why are some arrows red and others are blue?	• Health Connection, TE p. 484 • Why It Matters, SE p. 443 Evaluate Formative Assessment • Reteach, TE p. 485 • Throughout TE • Lesson Review, SE p. 447 Summative Assessment • Ocean Currents Alternative Assessment, TE p. 485 • Lesson Quiz **Additional Resources** • 6.ESSE2.2 Student Activity and Teacher Guide • Convection Currents Article • Waves & Currents STUDY JAMS!
