

Shelby County Schools Science Vision

Shelby County Schools' vision of science education is to ensure that from early childhood to the end of the 12th grade, all students have heightened curiosity and an increased wonder of science; possess sufficient knowledge of science and engineering to engage in discussions; are able to learn and apply scientific and technological information in their everyday lives; and have the skills such as critical thinking, problem solving, and communication to enter careers of their choice, while having access to connections to science, engineering, and technology.

To achieve this, Shelby County Schools has employed The Tennessee Academic Standards for Science to craft meaningful curricula that is innovative and provide a myriad of learning opportunities that extend beyond mastery of basic scientific principles.

Introduction

In 2014, the Shelby County Schools Board of Education adopted a set of ambitious, yet attainable goals for school and student performance. The District is committed to these goals, as further described in our strategic plan, Destination 2025. In order to achieve these ambitious goals, we must collectively work to provide our students with high quality standards aligned instruction. The Tennessee Academic Standards for Science provide a common set of expectations for what students will know and be able to do at the end of each grade, can be located in the [Tennessee Science Standards Reference](#). Tennessee Academic Standards for Science are rooted in the knowledge and skills that students need to succeed in post-secondary study or careers. While the academic standards establish desired learning outcomes, the curricula provides instructional planning designed to help students reach these outcomes. The curriculum maps contain components to ensure that instruction focuses students toward college and career readiness. Educators will use this guide and the standards as a roadmap for curriculum and instruction. The sequence of learning is strategically positioned so that necessary foundational skills are spiraled in order to facilitate student mastery of the standards.

Our collective goal is to ensure our students graduate ready for college and career. Being College and Career Ready entails, many aspects of teaching and learning. We want our students to apply their scientific learning in the classroom and beyond. These valuable experiences include students being facilitators of their own learning through problem solving and thinking critically. The Science and Engineering Practices are valuable tools used by students to engage in understanding how scientific knowledge develops. These practices rest on important “processes and proficiencies” with longstanding importance in science education. The science maps contain components to ensure that instruction focuses students toward understanding how science and engineering can contribute to meeting many of the major challenges that confront society today. The maps are centered around five basic components: the Tennessee Academic Standards for Science, Science and Engineering Practices, Disciplinary Core Ideas, Crosscutting Concepts, and Phenomena.

The Tennessee Academic Standards for Science were developed using the National Research Council's 2012 publication, [A Framework for K-12 Science Education](#) as their foundation. The framework presents a new model for science instruction that is a stark contrast to what has come to be the norm in science classrooms. Thinking about science had become memorizing concepts and solving mathematical formulae. Practicing science had become prescribed lab situations with predetermined outcomes. The framework proposes a three-dimensional approach to science education that capitalizes on a child's natural curiosity. The Science Framework for K-12 Science Education provides the blueprint for developing the effective science practices. The Framework expresses a vision in science education that requires students to operate at the nexus of three dimensions of learning: Science and Engineering Practices, Crosscutting Concepts, and Disciplinary Core Ideas. The Framework identified a small number of disciplinary core ideas that all students should learn with increasing depth and sophistication, from Kindergarten through grade twelve. Key to the vision expressed in the Framework is for students to learn these disciplinary core ideas in the context of science and engineering practices. The importance of combining Science and Engineering Practices, Crosscutting Concepts and Disciplinary Core Ideas is stated in the Framework as follows:

Standards and performance expectations that are aligned to the framework must take into account that students cannot fully understand scientific and engineering ideas without engaging in the practices of inquiry and the discourses by which such ideas are developed and refined. At the same time, they cannot learn or show competence in practices except in the context of specific content. (NRC Framework, 2012, p. 218)

To develop the skills and dispositions to use scientific and engineering practices needed to further their learning and to solve problems, students need to experience instruction in which they use multiple practices in developing a particular core idea and apply each practice in the context of multiple core ideas. We use the term “practices” instead of a term such as “skills” to emphasize that engaging in scientific investigation requires not only skill but also knowledge that is specific to each practice. Students in grades K-12 should engage in all eight practices over each grade band. Crosscutting concepts have application across all domains of science. As such, they are a way of linking the different domains of science. Crosscutting concepts have value because they provide students with connections and intellectual tools that are related across the differing areas of disciplinary content and can enrich their application of practices and their understanding of core ideas. There are seven crosscutting concepts that bridge disciplinary boundaries, uniting core ideas throughout the fields of science and engineering. Their purpose is to help students deepen their understanding of the disciplinary core ideas and develop a coherent and scientifically based view of the world.

The map is meant to support effective planning and instruction to rigorous standards. It is *not* meant to replace teacher planning, prescribe pacing or instructional practice. In fact, our goal is not to merely “cover the curriculum,” but rather to “uncover” it by developing students’ deep understanding of the content and mastery of the standards. Teachers who are knowledgeable about and intentionally align the learning target (standards and objectives), topic, text(s), task, and needs (and assessment) of the learners are best-positioned to make decisions about how to support student learning toward such mastery.

DRAFT

Shelby County Schools

2019-2020

2 of 46

Teachers are therefore expected--with the support of their colleagues, coaches, leaders, and other support providers--to exercise their professional judgment aligned to our shared vision of effective instruction, the Teacher Effectiveness Measure (TEM) and related best practices. However, while the framework allows for flexibility and encourages each teacher/teacher team to make it their own, our expectations for student learning are non-negotiable. We must ensure all of our children have access to rigor—high-quality teaching and learning to grade level specific standards, including purposeful support of literacy and language learning across the content areas.

Learning Progression

At the end of the elementary science experience, students can observe and measure phenomena using appropriate tools. They are able to organize objects and ideas into broad concepts first by single properties and later by multiple properties. They can create and interpret graphs and models that explain phenomena. Students can keep notebooks to record sequential observations and identify simple patterns. They are able to design and conduct investigations, analyze results, and communicate the results to others. Students will carry their curiosity, interest and enjoyment of the scientific world view, scientific inquiry, and the scientific enterprise into middle school.

At the end of the middle school science experience, students can discover relationships by making observations and by the systematic gathering of data. They can identify relevant evidence and valid arguments. Their focus has shifted from the general to the specific and from the simple to the complex. They use scientific information to make wise decision related to conservation of the natural world. They recognize that there are both negative and positive implications to new technologies.

As an SCS graduate, former students should be literate in science, understand key science ideas, aware that science and technology are interdependent human enterprises with strengths and limitations, familiar with the natural world and recognizes both its diversity and unity, and able to apply scientific knowledge and ways of thinking for individual and social purposes.

Structure of the Standards

- Grade Level/Course Overview: An overview that describes that specific content and themes for each grade level or high school course.
- Disciplinary Core Idea: Scientific and foundational ideas that permeate all grades and connect common themes that bridge scientific disciplines.
- Standard: Statements of what students can do to demonstrate knowledge of the conceptual understanding. Each performance indicator includes a specific science and engineering practice paired with the content knowledge and skills that students should demonstrate to meet the grade level or high school course standards.

Purpose of Science Curriculum Maps

This map is a guide to help teachers and their support providers (e.g., coaches, leaders) on their path to effective, college and career ready (CCR) aligned instruction and our pursuit of Destination 2025. It is a resource for organizing instruction around the Tennessee Academic Standards for Science, which define what to teach and what students need to learn at each grade level. The map is designed to reinforce the grade/course-specific standards and content (scope) and provides *suggested* sequencing, pacing, time frames, and aligned resources. Our hope is that by curating and organizing a variety of standards-aligned resources, teachers will be able to spend less time wondering what to teach and searching for quality materials (though they may both select from and/or supplement those included here) and have more time to plan, teach, assess, and reflect with colleagues to continuously improve practice and best meet the needs of their students.

The map is meant to support effective planning and instruction to rigorous standards. It is *not* meant to replace teacher planning, prescribe pacing or instructional practice. In fact, our goal is not to merely “cover the curriculum,” but rather to “uncover” it by developing students’ deep understanding of the content and mastery of the standards. Teachers who are knowledgeable about and intentionally align the learning target (standards and objectives), topic, text(s), task, and needs (and assessment) of the learners are best-positioned to make decisions about how to support student learning toward such mastery. Teachers are therefore expected—with the support of their colleagues, coaches, leaders, and other support providers—to exercise their professional judgment aligned to our shared vision of effective instruction, the Teacher Effectiveness Measure (TEM) and related best practices. However, while the framework allows for flexibility and encourages each teacher/teacher team to make it their own, our expectations for student learning are non-negotiable. We must ensure all of our children have access to rigor—high-quality teaching and learning to grade level specific standards, including purposeful support of literacy and language learning across the content areas.

Explanation(s) and Support of Standard(s) from TN Science Reference Guide

7.PS1.6 The state of matter of a substance is dependent on three factors: the intermolecular attractions between the atoms/molecules of the substance, the external pressure on the substance, and the temperature of the substance.

Models should account for particles, a vessel containing the particles, the motion (average kinetic energy) of the particles, and the total thermal energy of the system and the interactions between these components. Models can be used to explain why some substances such as hydrogen and helium atoms exist primarily as gasses due to very weak intermolecular attractions. Even very small amounts of motion are capable of overcoming the attractions between molecules.

This contrasts with substances such as ionic compounds which have extremely strong intermolecular attractions keeping atoms in a very organized crystal lattice pattern even at high temperatures. Pressure can be seen as an external force from surrounding matter pushing the particles closer together. Students should attribute pressure to the vessel containing the sample. It is logical to incorporate triple point diagrams into discussions.

Suggested Phenomenon

The density column displayed in the picture provides a visual for how the diversity of matter affects interactions between different materials. Whether an object sinks or floats depends on its density compared with the density of the liquid into which it is dropped. All types of matter—solids as well as liquids—are made up of many different atoms. Depending on the mass of these atoms, their size and the way they are arranged, different substances will have different densities. The density is characteristic for each individual compound and defined as the mass of a compound divided by its volume. In other words, the more matter there is in a certain amount of volume, the denser a substance is. Click on the picture to see how the density column was assembled. Explanation(s) and Support of Standard(s) from TN Science Reference Guide

7.PS1.5 Unlike properties such as atomic radii and electronegativity, the chemical and physical properties, referenced in this standard include bulk properties of matter. Bulk properties are only observable in a sample of a substance (element or compound) comprised of multiple particles, and are a result of the way that the particles interact with each other. Examples might include density, melting points, boiling point, solubility, flammability, color, or conductivity.

Whenever possible, connections in the behaviors of atoms should be connected back to the organization of the periodic table.

It is not necessary for students to explain the mechanisms (inter-molecular attractions) that cause the patterns in physical properties.

Suggested Science and Engineering Practice(s)

Analyzing and Interpreting Data 7.PS1.5

Students should create and analyze tables of data to identify relationships, consider statistical features within data and evaluate multiple data sets for a single phenomenon.

Suggested Phenomenon

The density column displayed in the picture provides a visual for how the diversity of matter affects interactions between different materials. Whether an object sinks or floats depends on its density compared with the density of the liquid into which it is dropped. All types of matter—solids as well as liquids—are made up of many different atoms. Depending on the mass of these atoms, their size and the way they are arranged, different substances will have different densities. The density is characteristic for each individual compound and defined as the mass of a compound divided by its volume. In other words, the more matter there is in a certain amount of volume, the denser a substance is. Click on the picture to see how the density column was assembled. reactants and products support the Law of Conservation of Mass.

Explanation(s) and Support of Standard(s) from TN Science Reference Guide

7.PS1.4 Analysis could include either analysis of models of a reaction, or analysis of data collected during a reaction. The purpose of the analysis is to gather evidence that the mass of the reacting substances does not change, although their form may. Balancing a chemical reaction is beyond the scope of this standard.

Models might include written chemical reactions, but should also be supplemented with physical models such as molecular sets that can be assembled, disassembled, and reassembled to demonstrate that rearrangement of atoms which occurs in a chemical reaction.

Analysis should include conceptually recognizing that the conservation of mass only occurs because the mass (total number of protons and neutrons per atom (7.PS1.1)) of each atom in the reactants does not change. Discussions of moles and molar masses are beyond the scope of the grade band.

Suggested Phenomenon

The reason why popcorn pops is the water trapped inside its kernel. If the kernel is heated to a high enough temperature, this water will transform into steam, a physical change. Due to the hard and mostly nonporous shell, the steam has nowhere to go, resulting in a buildup of pressure inside the kernel. Once the pressure gets high enough and the temperature reaches about 180 degrees Celsius (355 degrees Fahrenheit), the kernel hull bursts and the popcorn is turned inside out. Click on the picture above to see popcorn popping in slow motion. Students can complete a [See Think Wonder Template](#) while watching the video.

Models should account for particles, a vessel containing the particles, the motion (average kinetic energy) of the particles, and the total thermal energy of the system and the interactions between these components. Models can be used to explain why some substances such as hydrogen and helium atoms exist primarily as gasses due to very weak intermolecular attractions. Even very small amounts of motion are capable of overcoming the attractions between molecules.

This contrasts with substances such as ionic compounds which have extremely strong intermolecular attractions keeping atoms in a very organized crystal lattice pattern even at high temperatures. Pressure can be seen as an external force from surrounding matter pushing the particles closer together. Students should attribute pressure to the vessel containing the sample. It is logical to incorporate triple point diagrams into discussions.

Students should use models to connect how changes in pressure impact the change in thermal energy that is required for phase transformations to occur.

(Students are not expected to differentiate between the types of intermolecular attractions, merely to recognize that some force must be holding together the particles in a solid, and that overcoming this force causes a phase change.)

Suggested Phenomena

Firefighters hose down a fire inside a three-story building, but because of below zero temperatures the building turns to ice. Students can complete a [See Think Wonder Template](#) after examining the picture or viewing the video.

of all electrons, nor are they expected to list full configurations for electrons. These ideas may still be desirable to lead students to an understanding of valence electrons. Students should see the relationship between the number of valence electrons possessed by an element and its location on the periodic table.

Student should connect the components of their models (protons, neutrons, electrons) to arrangement of the periodic table. Models including locations and charges of subatomic particles are sufficient to explain relative sizes of atoms (the force of protons on electrons). These same discussions of atomic radius can extend into the general electronegativity trends, arising from repulsion of electrons as they are condensed in smaller radii. The idea of high electronegativity combining with low electronegativity will support patterns observable in way elements combine on the periodic table (7.PS1.5).

(Discussions of valence electrons should be limited to elements with only one common oxidation state, and only those with valence electrons in S and P orbitals.)

Suggested Phenomenon

Click on the picture to display the animation. All matter is formed from basic building blocks called atoms. Atoms are made of even smaller particles called protons, electrons, and neutrons. Protons and neutrons live in the nucleus of an atom and are almost identical in mass. However, protons have positive charges whereas neutrons have no charge. Electrons have a negative charge and orbit the nucleus in shells or electron orbitals and are much less massive than the other particles. Students can complete a [See Think Wonder Template](#) after examining the picture and/or animation.

Explanation(s) and Support of Standard(s) from TN Science Reference Guide

7.PS1.2 The word “molecule” is often over-generalized to describe a single particle of any compound. Only some substances (either elements or compounds) exhibit molecular behavior, and only those substances are referred to as molecules. Examples of molecular behaviors include low melting and boiling points, poor conductivity, and pliability.

The atoms bonded in a molecule are connected internally by a sharing of electrons. Molecular compounds are also described as covalent compounds because of this behavior.

Students should see that some single elements exist in a molecular form, with more than one atom bonded together in a pure form. The noble gases also exhibit molecular behavior, but in a monoatomic form. Students should also be able to differentiate between molecules of a diatomic element and compound molecules.

7.PS1.3 Pure substances have a single chemical composition and a single set of physical and chemical properties. These chemical and properties can be used to identify a pure substance (7.PS1.5). When a pair of pure substances are mixed, one of two outcomes is possible: the two substances do not interact, and the outcome is a mixture, or the two

Suggested Phenomenon

When pure cane sugar (white solid compound) is mixed with sulfuric acid (colorless liquid compound), a black mixture is formed. So how is it sulfuric acid turns sugar black? Click on the picture above to see the reaction, play the video for students without sound. Students can complete a [See Think Wonder Template](#) after viewing the video.

substances do interact, resulting in a new substance with new physical properties. In a mixture, each of the components of the mixture will retain its physical properties. This allows for separation of mixtures based on physical properties.

Students should track physical properties use physical properties to substantiate the classification of a substance. For example, if water and alcohol are combined, the resulting substance will have two boiling points: the boiling point of the alcohol (~70oC) and the boiling point of the water (100oC). If the two had combined, the resulting substance would have a single boiling point.

For purposes of this standard, it is reasonable to assume that if two substances do combine, they do so completely, resulting in a new pure substance without contaminants

Suggested Science and Engineering Practice(s)

Developing and Using Models 7.PS1.2

Students create models which are responsive and incorporate features that are not visible in the natural world, but have implications on the behavior of the modeled systems and can identify limitations of their models.

<u>Overarching Question(s)</u>						
How can one explain the structure, properties, and interactions of matter?						
Unit 1, Lesson 9	Lesson Length	Essential Question		Vocabulary		
Chemical Reactions	2 weeks	How are chemical reactions modeled?		chemical reaction, exothermic reaction, endothermic reaction, law of conservation of energy, law of conservation of mass, chemical formula, chemical equation, reactant, product		
Standards and Related Background Information		Instructional Focus		Instructional Resources		
DCI(s) PS1: Matter and Its Interactions Standard(s) 7.PS1.4 Analyze and interpret chemical reactions to determine if the total number of atoms in the reactants and products support the Law of Conservation of Mass. Explanation(s) and Support of Standard(s) from TN Science Reference Guide <u>7.PS1.4</u> Analysis could include either analysis of models of a reaction, or analysis of data collected		Learning Outcomes <ul style="list-style-type: none"> Describe what happens to the atoms of a substance during a chemical reaction. Identify and describe signs that a chemical reaction take place. Identify and describe the parts of a chemical formula. Identify and describe the reactants and products in a chemical reaction. Balance a chemical equation to demonstrate that chemical reactions observe the law of conservation of mass. 		Curricular Resources HMH Tennessee Science TE, Unit 2, Lesson 3 pp. 154-167 <u>Engage</u> <ul style="list-style-type: none"> Engage Your Brain #1 and 2, SE p. 123 Active Reading #3, SE p. 123 Chemical Changes in Apples Daily Demo, TE p. 156 <u>Explore</u> Chemical Reactions <ul style="list-style-type: none"> Breaking Bonds in a Chemical Reaction Quick Lab, TE p. 157 <u>Explain</u>		

during a reaction. The purpose of the analysis is to gather evidence that the mass of the reacting substances does not change, although their form may. Balancing a chemical reaction is beyond the scope of this standard.

Models might include written chemical reactions, but should also be supplemented with physical models such as molecular sets that can be assembled, disassembled, and reassembled to demonstrate that rearrangement of atoms which occurs in a chemical reaction.

Analysis should include conceptually recognizing that the conservation of mass only occurs because the mass (total number of protons and neutrons per atom (7.PS1.1)) of each atom in the reactants does not change. Discussions of moles and molar masses are beyond the scope of the grade band.

Suggested Science and Engineering Practice(s)

Analyzing and Interpreting Data 7.PS1.4

Students should create and analyze tables of data to identify relationships, consider statistical features within data and evaluate multiple data sets for a single phenomenon.

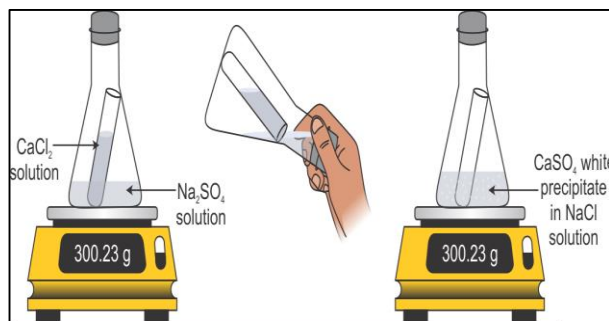

Suggested Crosscutting Concept(s)

Energy and Matter 7.PS1.4

Students demonstrate conservation of mass in physical and chemical changes.

- Compare exothermic and endothermic reactions.
- Describe how chemical reactions observe the law of conservation of energy.
- Describe factors that affect the rate of a chemical reaction.

Suggested Phenomenon

A test tube of calcium chloride (CaCl_2) is lowered into a flask of sodium sulfate (Na_2SO_4). The flask, test tube, and its content have a mass of 300.23 grams. The flask is tilted to allow the CaCl_2 in the test tube to react with the Na_2SO_4 inside the flask. The compounds react to form a white precipitate of calcium sulfate (CaSO_4) and a solution of sodium chloride (NaCl). The flask, test tube, and its contents have a mass of 300.23 grams. The reaction of calcium chloride and sodium sulfate occurred in a closed system with no change in mass. The total mass of the reactants is equal to the total mass of
